

Understanding Interest Rates

FIN 204 Lecture 2.1.

Petar Stankov

`petar.stankov@gmail.com`

16 Feb. 2009

Outline

- 1 What Are the Interest Rates?
- 2 The Internal Rate of Return
- 3 The Difference Between Interest Rates and the Rate of Return
- 4 Real and Nominal Interest Rates

Why are interest rates important?

Why are interest rates important?

- the most closely watched variables in the economy. Why?

Why are interest rates important?

Why are interest rates important?

- the most closely watched variables in the economy. Why?
- directly affect life of citizen and firms
- buy a house or invest on the stock market or put your money in a bank?
- invest in a new project, or buy government bonds?

What are the interest rates?

What are the interest rates?

Definition: Interest Rate

Interest rate is the amount of money that a given asset or debt instrument worth 100 units of money produces per unit of time to its owner

However, assets live infinitely long, bonds can be very short-term. How do we compare the money that they produce for us?:

What are the interest rates?

What are the interest rates?

Definition: Interest Rate

Interest rate is the amount of money that a given asset or debt instrument worth 100 units of money produces per unit of time to its owner

However, assets live infinitely long, bonds can be very short-term. How do we compare the money that they produce for us?: *present value*

The Present Value

You win a lottery promising 1 mln. per year for 10 yrs. Did you win 10 mln?

The Present Value

You win a lottery promising 1 mln. per year for 10 yrs. Did you win 10 mln?

Definition: Present Value

Present Value of an asset is what the lifetime yield of an asset is worth today

How do we calculate the present value of an asset?

Calculating the Present Value

Suppose you give a loan of 100 to your friend.
You require 10% back at the end of the period.
How much will you get at the end of the period?

Calculating the Present Value

Suppose you give a loan of 100 to your friend.
You require 10% back at the end of the period.
How much will you get at the end of the period?

$$100 + 10 = 110 =$$

Calculating the Present Value

Suppose you give a loan of 100 to your friend.
You require 10% back at the end of the period.
How much will you get at the end of the period?

$$100 + 10 = 110 = 100 + 0.1 \times 100 =$$

Calculating the Present Value

Suppose you give a loan of 100 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$100 + 10 = 110 = 100 + 0.1 \times 100 = 100(1 + 0.1)^1$$

Calculating the Present Value

Suppose you give a loan of 100 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$100 + 10 = 110 = 100 + 0.1 \times 100 = 100(1 + 0.1)^1$$

Suppose you give these 110 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

Calculating the Present Value

Suppose you give a loan of 100 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$100 + 10 = 110 = 100 + 0.1 \times 100 = 100(1 + 0.1)^1$$

Suppose you give these 110 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$110 + 11 = 121 = 100(1 + 0.1)^2$$

Calculating the Present Value

Suppose you give a loan of 100 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$100 + 10 = 110 = 100 + 0.1 \times 100 = 100(1 + 0.1)^1$$

Suppose you give these 110 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$110 + 11 = 121 = 100(1 + 0.1)^2$$

Suppose you give these 121 to your friend again.

You require 10% back at the end of the period.

How much will you get at the end of the period?

Calculating the Present Value

Suppose you give a loan of 100 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$100 + 10 = 110 = 100 + 0.1 \times 100 = 100(1 + 0.1)^1$$

Suppose you give these 110 to your friend.

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$110 + 11 = 121 = 100(1 + 0.1)^2$$

Suppose you give these 121 to your friend again.

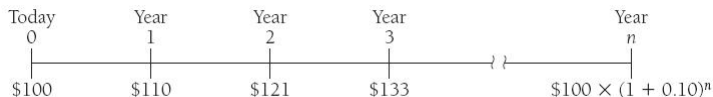

You require 10% back at the end of the period.

How much will you get at the end of the period?

$$121 + 12.1 = 131.1 = 100(1 + 0.1)^3$$

Calculating the Present Value

How to generalize the argument for n periods?

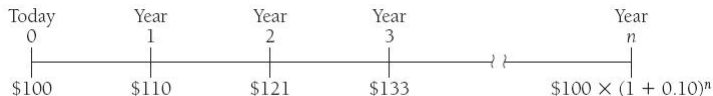

The **present value** is:

$$PV = \frac{FV}{(1 + i)^n}$$

Back to the lottery example. How much did you really win?

Calculating the Present Value

How to generalize the argument for n periods?

The **present value** is:

$$PV = \frac{FV}{(1 + i)^n}$$

Back to the lottery example. How much did you really win?
6,759,019 or something;-)

The Yield to Maturity (Internal Rate of Return)

The Internal Rate of Return (IRR) is the most accurate measure of interest rates; It is what economists mean when they use the term interest rate.

Definition: Internal Rate of Return (IRR)

The **IRR** is an *interest rate* with a special quality: it equates the present value of payments received from a debt instrument with its value today

How do we calculate the IRR?

Calculating the IRR for a simple loan

How to calculate the IRR of a 1-year simple loan with 10% interest rate?

Value today

100

Present value

$$\frac{110}{1+i}$$

Now solve for i .

$i = \dots$

Calculating the IRR for a simple loan

How to calculate the IRR of a 1-year simple loan with 10% interest rate?

Value today

100

Present value

$$\frac{110}{1+i}$$

Now solve for i .

$i = \dots$

For simple loans, the interest rate equals the IRR.

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$.

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$. Interest rate (coupon payment, yield) at the end of the year $C = 10\% = 10$.

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$. Interest rate (coupon payment, yield) at the end of the year $C = 10\% = 10$. The change in the price $p_{t+1} - p_t = 20$.

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$. Interest rate (coupon payment, yield) at the end of the year $C = 10\% = 10$. The change in the price $p_{t+1} - p_t = 20$. The rate of return = ?

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$. Interest rate (coupon payment, yield) at the end of the year $C = 10\% = 10$. The change in the price $p_{t+1} - p_t = 20$. The rate of return = ? Let's follow the definition:

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$. Interest rate (coupon payment, yield) at the end of the year $C = 10\% = 10$. The change in the price $p_{t+1} - p_t = 20$. The rate of return = ? Let's follow the definition:

$$RET = C +$$

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$. Interest rate (coupon payment, yield) at the end of the year $C = 10\% = 10$. The change in the price $p_{t+1} - p_t = 20$. The rate of return = ? Let's follow the definition:

$$RET = \frac{C + p_{t+1} - p_t}{p_t}$$

The Difference Between Interest Rates and the Rate of Return

Is the interest rate an accurate measure of what an asset can bring you?
Does the price of the asset matter?

Definition: Rate of return

Rate of return of an asset is the interest payments to the owner *plus* the change in its value, expressed as a fraction of its purchase price

Example: A bond with price $p_t = 100$. Interest rate (coupon payment, yield) at the end of the year $C = 10\% = 10$. The change in the price $p_{t+1} - p_t = 20$. The rate of return = ? Let's follow the definition:

$$RET = \frac{C + p_{t+1} - p_t}{p_t}$$

Disentangling the Rate of Return

What stands behind it?

Definition: Current yield

Current yield of an asset is the interest payments to the owner expressed as a fraction of its purchase price: $i_c = \frac{C}{p_t}$

Definition: Capital gain

Capital gain of an asset is the increase of its price expressed as a fraction of its purchase price: $g = \frac{p_{t+1} - p_t}{p_t}$

Disentangling the Rate of Return

What stands behind it?

Definition: Current yield

Current yield of an asset is the interest payments to the owner expressed as a fraction of its purchase price: $i_c = \frac{C}{p_t}$

Definition: Capital gain

Capital gain of an asset is the increase of its price expressed as a fraction of its purchase price: $g = \frac{p_{t+1} - p_t}{p_t}$

Therefore

$$RET = C +$$

Disentangling the Rate of Return

What stands behind it?

Definition: Current yield

Current yield of an asset is the interest payments to the owner expressed as a fraction of its purchase price: $i_c = \frac{C}{p_t}$

Definition: Capital gain

Capital gain of an asset is the increase of its price expressed as a fraction of its purchase price: $g = \frac{p_{t+1} - p_t}{p_t}$

Therefore

$$RET = \frac{C + p_{t+1} - p_t}{p_t}$$

Disentangling the Rate of Return

What stands behind it?

Definition: Current yield

Current yield of an asset is the interest payments to the owner expressed as a fraction of its purchase price: $i_c = \frac{C}{p_t}$

Definition: Capital gain

Capital gain of an asset is the increase of its price expressed as a fraction of its purchase price: $g = \frac{p_{t+1} - p_t}{p_t}$

Therefore

$$RET = \frac{C + p_{t+1} - p_t}{p_t} =$$

Disentangling the Rate of Return

What stands behind it?

Definition: Current yield

Current yield of an asset is the interest payments to the owner expressed as a fraction of its purchase price: $i_c = \frac{C}{p_t}$

Definition: Capital gain

Capital gain of an asset is the increase of its price expressed as a fraction of its purchase price: $g = \frac{p_{t+1} - p_t}{p_t}$

Therefore

$$RET = \frac{C + p_{t+1} - p_t}{p_t} = \frac{C}{p_t} + \frac{p_{t+1} - p_t}{p_t} =$$

Disentangling the Rate of Return

What stands behind it?

Definition: Current yield

Current yield of an asset is the interest payments to the owner expressed as a fraction of its purchase price: $i_c = \frac{C}{p_t}$

Definition: Capital gain

Capital gain of an asset is the increase of its price expressed as a fraction of its purchase price: $g = \frac{p_{t+1} - p_t}{p_t}$

Therefore

$$RET = \frac{C + p_{t+1} - p_t}{p_t} = \frac{C}{p_t} + \frac{p_{t+1} - p_t}{p_t} = i_c + g$$

Pretty different concepts: the *interest rate*, the *rate of return*, and the *internal rate of return*.

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Because money loses its value over time.

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Because money loses its value over time.

Example:

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Because money loses its value over time.

Example: A deposit in a bank with 5% interest rate.

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Because money loses its value over time.

Example: A deposit in a bank with 5% interest rate. Expected inflation rate is 7%. How much is your money worth today?

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Because money loses its value over time.

Example: A deposit in a bank with 5% interest rate. Expected inflation rate is 7%. How much is your money worth today?

Answer: $FV = 100(1 + 0.05) = 105$.

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Because money loses its value over time.

Example: A deposit in a bank with 5% interest rate. Expected inflation rate is 7%. How much is your money worth today?

Answer: $FV = 100(1 + 0.05) = 105$. However,

$$PV = \frac{FV}{1+0.07} = \frac{105}{1.07} =$$

Real and Nominal Interest Rates

What is the effect of inflation on interest rates?

Definition: Nominal Interest Rate

The **Nominal Interest Rate** is the interest rate that is written down in a mortgage contract, on the face of a bond as a coupon, or on another debt instrument such as a fixed-term loan

Definition: Real Interest Rate

The **Real Interest Rate** is the inflation-adjusted nominal interest rate:

$$i_r = i - \pi_e$$

Why do we need the real interest rate?

Because money loses its value over time.

Example: A deposit in a bank with 5% interest rate. Expected inflation rate is 7%. How much is your money worth today?

Answer: $FV = 100(1 + 0.05) = 105$. However,

$$PV = \frac{FV}{1+0.07} = \frac{105}{1.07} = 98.13$$

Real and Nominal Interest Rates

How do the real and nominal interest rates compare?
